

Control Monitor

Azilon Process Control

Monitors
ongoing
health of
your
financial
systems &
provides
continuous
feedback

Companies today are trying to integrate their governance, risk management and compliance activities to make them more consistent, efficient and relevant. For this, technologies are needed to monitor business activities in real-time so as to limit risk and noncompliance.

Azilon's Control Monitor enables organizations to do this by continually testing the controls for various business units. The core components of the Control Monitor include the Rule Engine to enable control owners to configure and automate the control parameter and the Control Testing engine to test and monitor the controls on a continuous basis. This allows the organization to adopt a uniform approach for control testing across the business units thereby reducing its internal audit costs, mitigating risks at an early stage and also gaining complete transaction coverage rather than just a sampling.

Azilon offers two innovative solutions under this product category, the Audit Workbench and the Automated Control Test.

Audit Workbench

The Audit Workbench manages the control testing lifecycle addressing audit project, audit scheduling, control testing, control test verification, audit workflow, and control issue resolution.

Automated Control Test

Automated Control Test enables auditors, compliance managers, and business managers to test and monitor financial controls in an automated and continuous manner without going through manual data verification testing.
